

CFC Crash Course

An Introduction to ColdFusion Components

alagad

120 Nelson Lane, Clayton, NC 27527 | p 1 (888) ALAGADA | f 1 (888) 248.7836 | www.alagad.com | info@alagad.com

Doug Hughes, President

What You Will Learn

- What a ColdFusion Component (CFC) is
- How to write and use CFCs
- CFC Best Practices
- Overview of Object Oriented Programming with CFCs

120 Nelson Lane, Clayton, NC 27527 | p 1 (888) ALAGADA | f 1 (888) 248.7836 | www.alagad.com | info@alagad.com

Why Use ColdFusion Components? (page 1)

- Code Reuse
- CFCs are similar to custom tags but with multiple entry points and ability to hold their own data.
- Black boxes
 - Developers shouldn't care about implementation details "under the hood".
 - A developer only needs to know the interface.

120 Nelson Lane, Clayton, NC 27527 | p 1 (888) ALAGADA | f 1 (888) 248.7836 | www.alagad.com | info@alagad.com

Why Use ColdFusion Components? (page 2)

- Organization
 - CFCs can be organized into a hierarchy of packages.
- CFCs bring the power of Object Oriented Programming to ColdFusion
- Remotely expose your business logic.
- Web Services and Flash Remoting

120 Nelson Lane, Clayton, NC 27527 | p 1 (888) ALAGADA | f 1 (888) 248.7836 | www.alagad.com | info@alagad.com

Why Use ColdFusion Components? (page 3)

- CFCs are the foundation of most modern frameworks.
 - Model-Glue
 - Mach II
 - Fusebox
 - Reactor
 - ColdSpring
 - Etc, etc.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

What Does a CFC Do?

- A CFC...
 - Holds Data (like a structure)
 - Provides mechanisms for acting on its data (functions)

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Terminology

• Class / Component:

- This is the CFC file you write.
- A blueprint for an object.
- Defines the data a CFC can hold and the actions that can be taken on that data.
- Example: Cat.cfc

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Terminology

• Property:

- Describes a characteristic of an object
- Data held within the CFC.
- Example: color, weight, furLength, name

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Terminology

● Methods / Functions:

- Defines something the object can do.
- Used to act upon properties.
- Examples: meow(), nap(duration), eat(food)

120 Nielsen Lane, Clayton, NC 27527 | p 1 8881 ALAGAD | f 1 8881 248.7836 | www.alagad.com | info@alagad.com

Terminology

● Object

- A particular instance of a class
- An instantiation of a CFC
- Example:
 - My Cat sam with short gray hair weighs 15 pounds.

120 Nielsen Lane, Clayton, NC 27527 | p 1 8881 ALAGAD | f 1 8881 248.7836 | www.alagad.com | info@alagad.com

Key Points

- Classes describe objects.
- Objects are one instance of a class.

120 Nielsen Lane, Clayton, NC 27527 | p 1 8881 ALAGAD | f 1 8881 248.7836 | www.alagad.com | info@alagad.com

The Parts of a CFC

- <cfcomponent>
Defines a component (a Class)
- <cfunction>
Defines a function (a Method)
- <cfargument>
Defines a parameter of a function.
- <cfreturn>
Returns results from a function.

120 Nielsen Lane, Clayton, NC 27527 | p 1 8881 ALAGAD | f 1 8881 248.7836 | www.alagad.com | info@alagad.com

<cfcomponent>

- CFCs are wrapped in a <cfcomponent> tag.
- All CFC code is placed inside the <cfcomponent> tag.
- The <cfcomponent> tag and contents are placed in a file with a “.cfc” extension.
- Example: HelloWorld.cfc
- Only one component per “.cfc” file.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

<cffunction>

- Defines a method - something our CFC can do.
- Can accept arguments using the <cfargument> tag.
- Returns results using the <cfreturn> tag.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

A Very Simple Example

```
<cfcomponent>

    <cffunction name="sayHello">
        <cfreturn "Hello World!" />
    </cffunction>

</cfcomponent>
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

<cffunction> Attributes

Name

- Required, specifies the function's name
- Used to invoke the function from an instance

Access

- Indicates the context from which the function can be invoked
- Options are: public, private, protected, remote

Hint

- Developer provided documentation about the function

Output

- When true, the function behaves like a <cfoutput> tag
- When false, the function behaves as if in a <cfsilent> tag (use this!)

ReturnType

- Indicates the type of data which will be returned by the function

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

<cfreturn>

- Used to return a value from a function
- Data being returned must be of correct type
- Has no attributes

```
<cfreturn "Hello World!" />
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

A More Complete Simple Example

```
<cfcomponent hint="I am a hello world component">
<cffunction name="sayHello"
    returntype="string"
    access="public"
    output="false"
    hint="This method returns the string 'Hello World!'">
    <cfreturn "Hello World!" />
</cffunction>
</cfcomponent>
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

<cfargument>

- Used to define function arguments
- Used within a <cffunction> tag
- Arguments are placed into the arguments scope within the function

```
<cffunction name="echo">
    <cfargument name="string">
    <cfreturn arguments.string />
</cffunction>
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

<cfargument> Attributes

Name

- Required, specifies the argument's name

Hint

- Developer provided information about the argument
- Displayed in generated documentation

Required

- Indicates if the argument is required

Type

- Indicates the required type of variable to pass in

Default

- A default value for the argument
- Used when no value is provided

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Now What?

- You now know the basic building blocks of CFCs.
- How do you use them?

120 Nielsen Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

Instantiating CFCs and Invoking Methods

Instantiating a CFC

- Creating an instance of a CFC.
- Making a particular cat from the blueprint.

Invoking a Method

- Causing a method to execute.
- Making the Cat meow.

120 Nielsen Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

<cfinvoke>

- Invokes a function on a component or an instance.
- Pass arguments using the <cfinvokeargument> tag.
- This is quite verbose.

120 Nielsen Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

<cfobject>

- Creates an instance of an object
- Fairly verbose

120 Nielsen Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

CreateObject()

- Creates an instance of an object.
- Least verbose

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

Objects are Stateful

- Objects can store data inside themselves
- Similar to a structure.
- Several scopes into which data can be placed.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

Scope Considerations

This scope

- Creates a public property on the component

Variables scope

- Private to a CFC instance

'Var'ing variables

- Declares a variable local to a function

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

“This” Scope

- Publicly accessible properties
- No data verification
- No control over types
- Behaves somewhat like a structure in that the variables don't need to exist ahead of time.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALADAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

“Variables” Scope

- Privately accessible properties
- No data verification
- No control over types
- Not identifying a scope inside a CFC uses the CFC's Variables scope

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

‘Var’ed Variables

- Used only in functions
- Exist only for the duration of the function execution
- Un varred variables end up in the component's variables scope
- Varring Helps keep code thread safe and prevent strange bugs
- You must var any variable returned by tags
 - <cfquery>
 - <cffile>
 - A lot of tags return variables, whether you realize it or not.
- Must be placed after the last <cfargument> tag and the first line of code in a function

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

‘Var’ing Example

```
<cffunction name="foo">
  <cfargument name="bar" />
  <cfset var example = "Example value" />
  <!-- code goes here -->
</cffunction>
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Accessors and Mutators

- A fancy way to say Getters and Setters
- Accessor and Mutator methods are used to set and get the value of a private property
- Can specify a specific data type
- Allows for verifying data values
- Can make read only properties
- Best practice

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Constructors

- Constructors are code which is executed when a component is instantiated.
 - Provided by most OO languages
- ColdFusion does not provide constructors!
- Instead use Pseudo Constructors
 - Anything outside a <cffunction> tag in a component
 - Preferable to create a method named init() which accepts configuration settings and returns the configured object.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Pseudo Constructors

- Any code outside of a <cffunction> tag
- Executed when CFC instantiated
- Can be used to initialize variables with default values, etc.

```
<cfccomponent>
  <!-- begin pseudo constructor -->
  <cfset variables.foo = "bar" />

  <cffunction ...>
    <!-- do stuff -->
  </cffunction>
</cfccomponent>
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Init() method

- Preferable to the pseudo constructor area
- Add a method named “init” which configures and returns the object
- A standard convention in ColdFusion
- A good place to set configuration settings

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Packages

- CFCs are organized into packages
- Packages are directory names separated by periods
- Packages are relative to the base template path
- Mappings in the CF administrator can also be used as packages

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

CFC Lifespan

- A CFC “lives” only as long as the scope it’s in.
- You can place a CFC in a persistent scope to persist across multiple page requests
- Data in CFC persists along with the CFC

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

CFCs are Best used to represent something

- Not just a collection of functions
- Can be used to model real world concepts
- For instance:
 - Cat
 - Vehicle History Report
- ***This is the foundation of Object Oriented programming!***

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

Other Uses for CFCs

- Web Services
- Flash Remoting
- Event Gateways require CFCs
- Application.cfc
- And more!

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

The Three Tenets of Object Oriented Programming

- **Encapsulation**
- Inheritance
- Polymorphism

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | t 1 888 248 7836 | www.alagad.com | info@alagad.com

Three Tenets: Encapsulation

- **The component Has The Power!**

- Literally means is “Data Hiding”
- Perhaps the biggest advantages of OO
- Components become “black boxes”
- Reduces repeated business logic
- All a developer needs to know is the CFC’s interface (it’s functions and properties).

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Three Tenets: Encapsulation

- Account.cfc

```
<cfcomponent>
    <cffunction name="getBalance">
        <!-- do anything needed to get and return the balance -->
    </cffunction>

    <cffunction name="deposit">
        <!-- do anything needed to deposit funds -->
    </cffunction>
</cfcomponent>
```

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Encapsulation Eases Change

- If your logic is encapsulated you can change implementation without side effects.
- So long as the arguments and return value remain the same implementing code will not break.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Three Tenets: Inheritance

- A means by which a CFC can get all of the behavior and data of another CFC.
- An extending CFC can change the behavior of the extended CFC.
- Frequently abused
- **Favor Composition over Inheritance**
- Hard to understand, but very valuable.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Extending CFCs

- CFCs have the ability to “Extend” another CFC.
 - Get all the functionality of the parent CFC
 - Customize behavior
 - Access to private methods
- The CFC extended is known as the “super class”

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

The Super Keyword

- Can be used to call methods on a super class.
- Only supports one level of inheritance
 - super.xyz() works
 - super.super.xyz() does not work

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Three Tenets: Polymorphism

- Literally means “Many Forms”
- The language can treat two objects as if they are the same type
 - A lion and tiger are both types of cats
 - A Checking Account and a Savings Account are both types of Accounts.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Polymorphism in ColdFusion

- Provided by:
 - Inheritance
 - <cfinterface>
- Allows code to “know” how to interact with components.
 - If I know how to interact with an Account then I know how to interact with a Checking Account and Savings Account.

120 Nelson Lane, Clayton, NC 27527 | p 1 888 ALAGAD | f 1 888 248 7836 | www.alagad.com | info@alagad.com

Interfaces

- <cfinterface> tag
 - New in ColdFusion 8
- A contract that guarantees the functions an implementing CFC will have
- Provides for Polymorphism without Inheritance

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

Composition

- Composition means to build your component out of other components.
- A fantastic alternative to inheritance.
- Creates more cohesive components.

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

CFC Metadata

- <cfdump>
 - Dumps a description of the object.
 - Useless unless debugging.
- getMetaData()
 - Returns a structure of information on a component.

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

Interface Metadata

- getComponentMetaData()
 - Returns a structure of information on a class or interface.

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

Coding With Responsibilities

- CFCs should only be responsible for one thing
- CFCs should do that one thing well
- Ask yourself...
 - What should an object be responsible for?
 - What shouldn't an object be responsible for?

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

What You Learned

- What a CFC is
- Why to use CFCs
- How to write and use CFCs
- CFCs are the foundation of Object Oriented Programming

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

Questions and Answers

-

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

Exercise

- Create a CFC that will return a fortune and a query of categories
- Create a script that instantiates the CFC and calls the methods on it.
- Use the CFC in your procedural fortune application.
- Let me know when you're done.

120 Nelson Lane, Clayton, NC 27527 | p 1.888.1ALAGAD | f 1.888.248.7836 | www.alagad.com | info@alagad.com

Let's Discuss

- What problems did you run into?
- What problems do our foresee with CFCs?
- What are your thoughts about using CFCs so far?
- How did your CFC know which datasource to use?
- How does your CFC make use of encapsulation?
- Is your CFC cohesive? (hint: No, but why not?)

120 Neisen Lane, Clayton, NC 27527 | p 1 888 1 ALAGAD | t 1 888 218 7836 | www.alagad.com | info@alagad.com
